

**Listing of the Claims:**

The following Listing of the Claims is to replace all previous Listings of the Claims.

1 - 17. (Cancelled)

18. (Currently Amended) A method of determining, for a given nucleic acid sample, the identities of the nucleotides at a set of known polymorphic sites to be interrogated, said method comprising:

- a) subjecting to ~~an~~ a multiplex amplification regimen a population of primer extension products generated from a nucleic acid sample, each primer extension product comprising a member of a set of tag sequences, which tag sequence specifically corresponds to the presence of one specific nucleotide at a member of said set of known polymorphic site sites,

wherein said multiplex amplification regimen is performed using one upstream amplification primer for each sequence comprising a known polymorphic site to be interrogated, and a set of distinguishably labeled downstream amplification primers, each member of said set of downstream amplification primers comprising a said tag sequence comprised by a member of said population of primer extension products and a distinguishable label that specifically corresponds to the presence of a specific nucleotide at said polymorphic site, and wherein said upstream amplification primers are selected such that each polymorphic site of said set of known polymorphic sites to be interrogated corresponds to a distinctly sized amplification product;

- b) separating distinctly sized amplification products produced by said multiplex amplification reaction by size and/or by charge; and

- c) detecting incorporation of a distinguishable label in a plurality of distinctly sized amplification products, thereby to determine the identity of the nucleotide at each member of said set of said polymorphic site sites, wherein the same set of distinguishably labeled primers determines the identities of the nucleotides at all members of the set of target polymorphic sites.

19. (Original) The method of claim 18 wherein said distinguishable label is a fluorescent label.
20. (Cancelled)
21. (Previously Presented) The method of claim 18 wherein said separating comprises capillary electrophoresis.
22. (Previously Presented) The method of claim 18 wherein said amplification regimen comprises at least two amplification reaction cycles, wherein each cycle comprises the steps of: 1) nucleic acid strand separation; 2) oligonucleotide primer annealing; and 3) polymerase extension of annealed primers.
23. (Original) The method of claim 22 further comprising the steps, during said amplification regimen and after at least one of said reaction cycles, of removing an aliquot of said amplification reaction, separating nucleic acid molecules by size and/or by charge, and detecting the incorporation of a said distinguishable label, wherein said detecting determines the identity of the nucleotide at said polymorphic site.
24. (Original) The method of claim 23 wherein said removing, separating and detecting are performed after each cycle in said regimen.
25. (Original) The method of claim 23 wherein said separating comprises capillary electrophoresis.
26. (Previously Presented) The method of claim 18 wherein steps (a) – (c) are performed in a modular apparatus comprising a thermal cycler, a sampling device, a capillary electrophoresis device and a fluorescent detector.
27. (Original) The method of claim 18 wherein said tag sequence comprises 15 to 40 nucleotides.

28. (Original) The method of claim 18 wherein said set of distinguishably labeled downstream amplification primers consists of: a subset that comprises a tag sequence that specifically corresponds to the presence of A at the polymorphic site; a subset that comprises a tag sequence that specifically corresponds to the presence of C at the polymorphic site; a subset that comprises a tag sequence that specifically corresponds to the presence of G at the polymorphic site; and a subset that comprises a tag sequence that specifically corresponds to the presence of T at the polymorphic site.
29. (Original) The method of claim 18, further comprising the step, before step (a), of removing primers not incorporated when said population of primer extension products was made.
30. (Original) The method of claim 29 wherein said step of removing comprises degrading said primers not incorporated when said population of primer extension products was made.
31. (Original) The method of claim 30, wherein said degrading is performed using a heat labile exonuclease.
32. (Original) The method of claim 31 wherein said heat labile exonuclease is selected from the group consisting of Exonuclease I and Exonuclease VII.
33. (Original) The method of claim 32 wherein said heat labile exonuclease is thermally inactivated before continuing to step (a).
34. (Currently Amended) A method of determining, for a given nucleic acid sample, the identities of the nucleotides at a set of known polymorphic sites to be interrogated, said method comprising:
- a) subjecting to an amplification regimen, a population of primer extension products generated from a nucleic acid sample, each primer extension

product comprising a first tag sequence or its complement and a member of a set of second tag sequences or its complement, the presence of which second tag sequence or its complement specifically corresponds to the presence of one specific nucleotide at a member of said set of known polymorphic sites site, wherein for each polymorphic site in said set of polymorphic sites, said first tag sequence is located at a distinct distance 5' of said polymorphic site, relative to the distance of said first tag sequence from a polymorphic site on molecules in said sample containing other polymorphic sites, wherein said multiplex amplification regimen is performed using an upstream amplification primer comprising said first tag sequence, and a set of distinguishably labeled downstream amplification primers, each member of said set of downstream amplification primers comprising a said second tag sequence comprised by a member of said population of primer extension products and a distinguishable label that specifically corresponds to the presence of a specific nucleotide at said polymorphic site, and wherein said upstream amplification primers are selected such that each polymorphic site of said set of known polymorphic sites to be interrogated corresponds to a distinctly sized amplification product;

- b) separating a plurality of distinctly sized amplification products produced by said multiplex amplification regimen by size and/or by charge; and
- c) detecting incorporation of a distinguishable label in said plurality of distinctly sized amplification products, thereby to determine the identity of the nucleotide at each member of said set of said polymorphic site sites, wherein the same set of distinguishably labeled primers determines the identities of the nucleotides at all members of the set of target polymorphic sites.

35. (Original) The method of claim 34 wherein said distinguishable label is a fluorescent label.

36. (Cancelled)

37. (Currently Amended) The method of claim ~~36~~ 34 wherein said separating comprises capillary electrophoresis.
38. (Currently Amended) The method of claim 34 wherein said amplification regimen ~~comprising~~ comprises at least two amplification reaction cycles, wherein each cycle comprises the steps of: 1) nucleic acid strand separation; 2) oligonucleotide primer annealing; and 3) polymerase extension of annealed primers.
39. (Original) The method of claim 38 further comprising the steps, during said amplification regimen and after at least one of said reaction cycles, of removing an aliquot of said amplification reaction, separating nucleic acid molecules by size and/or by charge, and detecting the incorporation of a said distinguishable label, wherein said detecting determines the identity of the nucleotide at said polymorphic site.
40. (Original) The method of claim 39 wherein said removing, separating and detecting are performed after each cycle in said regimen.
41. (Original) The method of claim 39 wherein said separating comprises capillary electrophoresis.
42. (Previously Presented) The method of claim 34 wherein steps (a) – (c) are performed in a modular apparatus comprising a thermal cycler, a sampling device, a capillary electrophoresis device and a fluorescent detector.
43. (Currently Amended) The method of claim 34 wherein said first and/or said second tag sequences each ~~sequence~~ comprise[[s]] 15 to 40 nucleotides.
44. (Original) The method of claim 34 wherein said set of distinguishably labeled downstream amplification primers consists of: a subset that comprises a tag sequence that specifically corresponds to the presence of A at the polymorphic site; a subset that comprises a tag sequence that specifically corresponds to the presence of C at the

polymorphic site; a subset that comprises a tag sequence that specifically corresponds to the presence of G at the polymorphic site; and a subset that comprises a tag sequence that specifically corresponds to the presence of T at the polymorphic site.

45. (Original) The method of claim 34, further comprising the step, before step (a), of removing primers not incorporated when said population of primer extension products was made.
46. (Original) The method of claim 45 wherein said step of removing comprises degrading said primers not incorporated when said population of primer extension products was made.
47. (Original) The method of claim 46, wherein said degrading is performed using a heat labile exonuclease.
48. (Original) The method of claim 47 wherein said heat labile exonuclease is selected from the group consisting of Exonuclease I and Exonuclease VII.
49. (Original) The method of claim 48 wherein said heat labile exonuclease is thermally inactivated before continuing to step (a).
- 50 - 61. (Cancelled)
62. (Currently Amended) A multiplex method of determining the identities of single nucleotides present at a group of known polymorphic sites, said method comprising:
- I) providing a nucleic acid sample comprising said group of polymorphic sites;
  - II) separating the strands of said nucleic acid sample and re-annealing in the presence of:
    - a) a set of first oligonucleotide primers each comprising a 3' region that hybridizes to a sequence at a known distance upstream of a known polymorphic site of said group of polymorphic sites, each member of said

- set of first oligonucleotide primers comprising a common sequence tag located 5' of said 3' region, and each member of said set of first oligonucleotide primers selected such that a plurality of distinctly sized amplification product is generated for each polymorphic site in said group of known polymorphic sites; and
- b) a set of downstream amplification primers comprising, in 5' to 3' order:
- i) a sequence tag selected from the group consisting of a tag specifically corresponding to G as the 3'-terminal nucleotide of said primer; a tag specifically corresponding to A as the 3'-terminal nucleotide of said primer; a tag specifically corresponding to T as the 3'-terminal nucleotide of said primer; and a tag specifically corresponding to C as the 3'-terminal nucleotide of said primer;
  - ii) a region that specifically hybridizes to a sequence adjacent to and 3' of a polymorphic site in said group of polymorphic sites, wherein said set of downstream amplification primers comprises a subset of primers comprising a region that specifically hybridizes adjacent to said polymorphic site for each polymorphic site in said group of polymorphic sites; and
  - iii) a 3' terminal nucleotide selected from G, A, T or C, wherein said terminal nucleotide specifically corresponds to the sequence tag described in (i) on that downstream amplification primer, and wherein when said downstream amplification primer is hybridized to said sequence adjacent to and 3' of a polymorphic site, said 3' terminal nucleotide is opposite said polymorphic site;
- III) contacting the annealed oligonucleotides resulting from step (II) with a nucleic acid polymerase under conditions that permit the extension of an annealed oligonucleotide such that extension products are generated, wherein the primer extension product from the first oligonucleotide primer, when separated from its complement, can serve as a template for the synthesis of the extension product of as member of the set of second oligonucleotide primers, and vice versa;

- IV) repeating strand separating and contacting steps (II) and (III) two times, such that a reaction mixture comprising a population of nucleic acid molecules is generated that comprises both a sequence identical to or complementary to said first oligonucleotide and a sequence identical to or complementary to a member of said set of downstream amplification primers;
- V) contacting the population generated in step (IV) with a heat-labile exonuclease under conditions permitting the degradation of non-annealed oligonucleotide primers, such that non-annealed primers are degraded;
- VI) thermally inactivating said heat-labile exonuclease;
- VII) subjecting said population of nucleic acid molecules to ~~a~~ a multiplex amplification regimen, wherein said amplification regimen is performed using an upstream amplification primer comprising the common sequence tag comprised by said first oligonucleotide primer, and a set of distinguishably labeled downstream amplification primers, each member of said set of distinguishably labeled downstream amplification primers comprising a tag comprised by a member of said downstream amplification primers ~~set of second oligonucleotide primers and a distinguishable label~~;
- VIII) separating a plurality of distinctly sized amplification products by size and/or by charge; and
- IX) detecting incorporation of at least one distinguishable label in said plurality of distinctly sized amplification products, thereby determining the identities of the nucleotides present at a member of said set of said known polymorphic sites, wherein the same set of distinguishably labeled primers determines the identities of the nucleotides at all members of the set of target polymorphic sites.

63. (Currently Amended) The method of claim 62 wherein said distinguishably labeled downstream primers comprise a fluorescent moiety, ~~distinguishable label is a fluorescent label.~~

64. (Cancelled)

65. (Previously Presented) The method of claim 62 wherein said separating comprises capillary electrophoresis.
66. (Currently Amended) The method of claim 62 wherein said amplification regimen ~~comprising~~ comprises at least two amplification reaction cycles, wherein each cycle comprises the steps of: 1) nucleic acid strand separation; 2) oligonucleotide primer annealing; and 3) polymerase extension of annealed primers.
67. (Original) The method of claim 66 further comprising the steps, during said amplification regimen and after at least one of said reaction cycles, of removing an aliquot of said amplification reaction, separating nucleic acid molecules by size and/or by charge, and detecting the incorporation of a said distinguishable label, wherein said detecting determines the identity of the nucleotide at said polymorphic site.
68. (Original) The method of claim 67 wherein said removing, separating and detecting are performed after each cycle in said regimen.
69. (Previously Amended) The method of claim 62 wherein steps I- IX are performed in a modular apparatus comprising a thermal cycler, a sampling device, a capillary electrophoresis device and a fluorescent detector.
70. (Currently Amended) The method of claim 62 wherein said first and/or said second tag sequences each comprise 15 to 40 nucleotides.
71. (Original) The method of claim 62 wherein said 3' region that hybridizes to a sequence at a known distance upstream of said known polymorphic site comprises 10-30 nucleotides.
72. (Original) The method of claim 62 wherein said region that hybridizes 3' of and adjacent to said polymorphic site comprises 10-30 nucleotides.

73. (Original) The method of claim 62 wherein said set of distinguishably labeled downstream amplification primers consists of: a subset that comprises a tag sequence that specifically corresponds to the presence of A at the polymorphic site; a subset that comprises a tag sequence that specifically corresponds to the presence of C at the polymorphic site; a subset that comprises a tag sequence that specifically corresponds to the presence of G at the polymorphic site; and a subset that comprises a tag sequence that specifically corresponds to the presence of T at the polymorphic site.
74. (Withdrawn) A kit for the determination of the nucleotide present at a polymorphic site present on a nucleic acid sample, said kit comprising a set of upstream primers comprising:
- a) a first primer comprising a 5'-tag sequence and 3' sequence sufficient to specifically hybridize at a known distance upstream of a known polymorphic site; and
  - b) a set of 4 downstream second primers, comprising in 5' to 3' order:
    - i) a sequence tag selected from the group consisting of a tag specifically corresponding to G as the 3'-terminal nucleotide of said primer; a tag specifically corresponding to A as the 3'-terminal nucleotide of said primer; a tag specifically corresponding to T as the 3'-terminal nucleotide of said primer; and a tag specifically corresponding to C as the 3'-terminal nucleotide of said primer;
    - ii) a region that specifically hybridizes to a sequence adjacent to and 3' of a polymorphic site in said group of polymorphic sites, wherein said set of downstream amplification primers comprises a subset of primers comprising a region that specifically hybridizes adjacent to said polymorphic site for each polymorphic site in said group of polymorphic sites; and
    - iii) a 3' terminal nucleotide selected from G, A, T or C, wherein said terminal nucleotide specifically corresponds to the sequence tag described in (i) on that downstream amplification primer, and wherein when said downstream amplification primer is hybridized to said sequence adjacent to and 3' of a polymorphic site, said 3' terminal nucleotide is opposite said polymorphic site.

75. (Withdrawn) The kit of claim 74, further comprising a set of 5 primers lacking sequence specific for a gene in the genome of the organism being examined for polymorphisms, said primers comprising a primer comprising the tag sequence of said first primer and a set of four distinguishably labeled primers comprising the tag sequences of said set of four downstream second primers.
